

Mining is one of Canada's most important economic sector and a major job creator. In our history of servicing the mining industry, we have seen a trend toward fewer larger, more efficient facilities with fewer employees and more technology.

The mining industry is characterized by harsh environmental conditions. They have no control over commodity prices and must manage operational cost to be profitable. Operators are eager to adopt new technologies to increase reliability, efficiency and safety.

It is imperative to production that products/technologies selected are able to withstand the harsh environment found in mining. Whether is it an underground / Open pit mine, mill, smelter or refinery. Chess Controls represent trusted manufacturers of quality products built for the mining industry.

Mine Power – Automation – Process Control – Power Distribution – Valve  
 With over 35 years of experience in servicing the mining industry, Chess Controls has the experience and quality products to deliver the best solution on time and on budget.
